## ABM Protocols

# ABM Clinical Protocol #2 (2007 Revision): Guidelines for Hospital Discharge of the Breastfeeding Term Newborn and Mother: "The Going Home Protocol"

THE ACADEMY OF BREASTFEEDING MEDICINE CLINICAL PROTOCOL COMMITTEE

---

*A central goal of the Academy of Breastfeeding Medicine is the development of clinical protocols for managing common medical problems that may impact breastfeeding success. These protocols serve only as guidelines for the care of breastfeeding mothers and infants and do not delineate an exclusive course of treatment or serve as standards of medical care. Variations in treatment may be appropriate according to the needs of an individual patient.*

### BACKGROUND

The ultimate success of breastfeeding is measured in part by both the duration of breastfeeding and the exclusivity of breastfeeding. Anticipatory attention to the needs of the mother and baby at the time of discharge from the hospital is crucial to ensure successful, long-term breastfeeding. The following principles and practices are recommended for consideration prior to sending a mother and her full-term infant home.

### GUIDELINES

1. Formal documented assessment of breastfeeding effectiveness should be performed at least once during the last 8 hours preceding discharge of the mother and baby, by a medical professional trained in formal assessment of breastfeeding. Similar assessments should have been performed during the hospitalization, preferably at least once every 8 to 12 hours. These should include
2. evaluation of positioning, latch, milk transfer, baby's weight and percent weight loss, clinical jaundice, and stool and urine output. All problems raised by the mother such as nipple pain, ability to hand express, perception of inadequate supply, and any perceived need to supplement must also be addressed.<sup>1-10</sup>
3. Prior to discharge, anticipation of breastfeeding problems should be assessed based on the maternal and/or infant risk factors (Tables 1 and 2): All problems with breastfeeding, whether observed by hospital staff or raised by the mother should be attended to and documented in the medical record prior to discharge of mother and baby. A plan of action that includes follow-up of the problem after discharge must be in place.<sup>1-17</sup>
3. Physicians, midwives, nurses, and all other staff should encourage the mother to practice exclusive breastfeeding for the first 6 months of the infant's life and to continue breastfeeding through at least the first year of life, preferably to 2 years of life and beyond. The addition of appropriate comple-
